## To whom it may concern

I herewith submit my opinion regarding the blood test analyses of Mr. Pascal Najadi, dated 28 February 2023, performed by Prof. Dr. Brigitte König, Magdeburg Laboratory, Germany.

The test results clearly indicate that Mr. Najadi is suffering from irreparable long-term effects provoked by the injected mRNA product manufactured by Pfizer/Biontech. The agent is a substance with life-threatening toxic properties that stem from two sources. The first is the packaging material that is required to protect the mRNA and enable the gene to be taken up into cells. The packaging material contains large amounts of positively charged, cationic lipids that are man-made and do not occur in nature. Myriad cellular functions are normally maintained through the action of negatively charged molecules, and interference of these functions by positively charged lipids is inevitable. Specifically, it is established that cationic lipids compromise mitochondrial function and this causes depletion of energy that can lead to cell death (1).

The dangerous nature of cationic lipids has long been known and their use in humans was prohibited prior to 2020. This rule was violated with the emergency use approval of the Biontech/Pfizer vaccine.

Biontech did declare that preclinical safety studies had been conducted. However, this is today known to have been a blatant untruth. Biontech/Pfizer did not conduct a single preclinical study that documented the safety of their product. On the other hand, a scientific investigation published in 2021 showed the complete opposite: cationic lipids contained in the mRNA packaging material are highly toxic and cause severe inflammatory tissue reactions at the injection site of mice (2) similar to what is observed in many vaccine recipients (3). Intranasal instillation in the mice led to severe pneumonia with often fatal outcome (2). Of note, the concentration of cationic lipids present in the Pfizer vaccine is more than **tenfold** higher than the concentration applied to mice (3), and **one-hundred** fold higher than the concentration that was found to reduce cell energy (ATP) and initiate cell death in laboratory experiments (1).

The second mortal danger of the COVID19 vaccine is the spike protein that is produced by myriad cells throughout the body. The spike gene was manipulated to create a gain-of-function mutant and fulfills the definition of a bioweapon. Billions of the weaponized genes are injected, and an unfathomable number enter the bloodstream to reach all parts of the body. Systemic dissemination of such exorbitant numbers of alien genes never occurs during any natural virus infection. Following vaccination, spike production rapidly commences throughout the body. The spike protein itself is highly toxic. The ultimate catastrophe, however, derives from the fact that the immune system recognizes and attacks all cells that produce a foreign "non-self" protein. In effect, COVID-vaccination thus induces generalized autoimmune diseases with myriad possible consequences and manifestations. Publications attesting to this fact are readily available in the scientific literature.

Manufacturers of the gene-based COVID-vaccines continue to market their products in the face of all the damning evidence that calls for their immediate withdrawal. It is now known that the lifetime of the artificial mRNA is far longer than that of naturally occurring mRNA. Therefore, autoimmune events will be long-lasting and intensify with every booster injection. With regard to the cationic lipids, no pathway for their degradation and removal from cells has yet been discovered. It must be feared that repeated injections result in their accumulation, thus also prolonging and augmenting their toxic properties.

Mr. Najadi enjoyed the best of health prior to vaccination. Since then, however, he suffers from chronic fatigue, weakness, anxiety and mental depression. His blood tests reveal marked reduction in cellular ATP-levels and elevation of CRP, the marker of systemic inflammation. This must be a cause of gravest concern. ATP produced by mitochondria is the currency of the living cell. Compromise of mitochondrial function reduces ATP-levels and shortens the lifespan of cells (5). Chronic inflammation increases the demand on ATP and will intensify the detrimental effects of mitochondrial impairment.

All the available scientific evidence indicates that the PfizerBiontech injections have shortened Mr.Najadi's life expectancy. He is mortally wounded, a fate that is being shared by countless world citizens who were lulled or coerced into receiving the experimental COVID-vaccine without any informed or written consent. The burden of proof must be reversed and in the name of all the aggrieved, I call on justice to now be done.
